

Ball Rol Tester

The ball Roll Tester measures how far the ball rolls on synthetic grass. The distance the ball rolls is directly related to the speed of the synthetic turf.

Why should you perform the Ball Roll Tester? Over time, synthetic turf fibres can begin to “lay flat” and the infill can become compacted, resulting in a longer, faster ball roll than preferred. This test can identify the condition of the field and alert the owner that the field requires better maintenance to avoid worsening problems.

Infill Tester

The Infill Tester is an device you can easily and accurately measure your infill material on synthetic grass.
